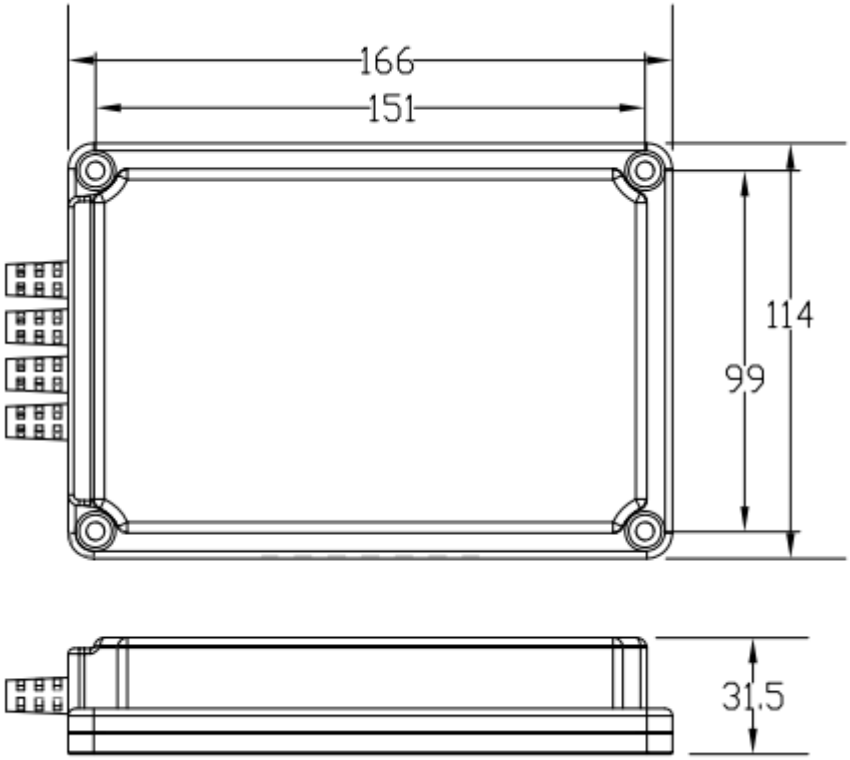
MXES-DT24_V2.2(2021.03.20)

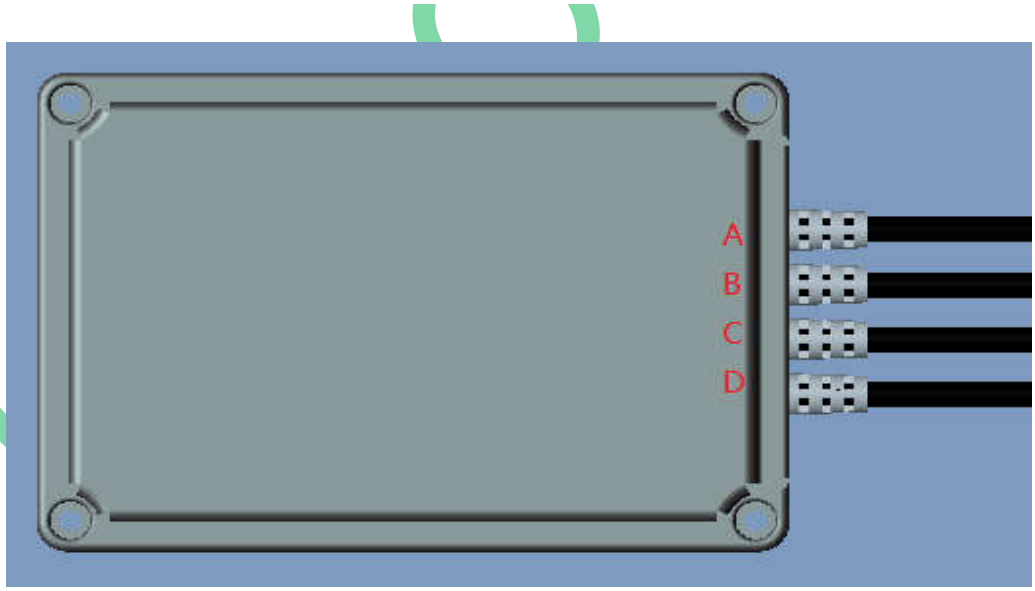
Charpter one: Introduction

1.1 Dual drive controller

1.2 Rated value and specification

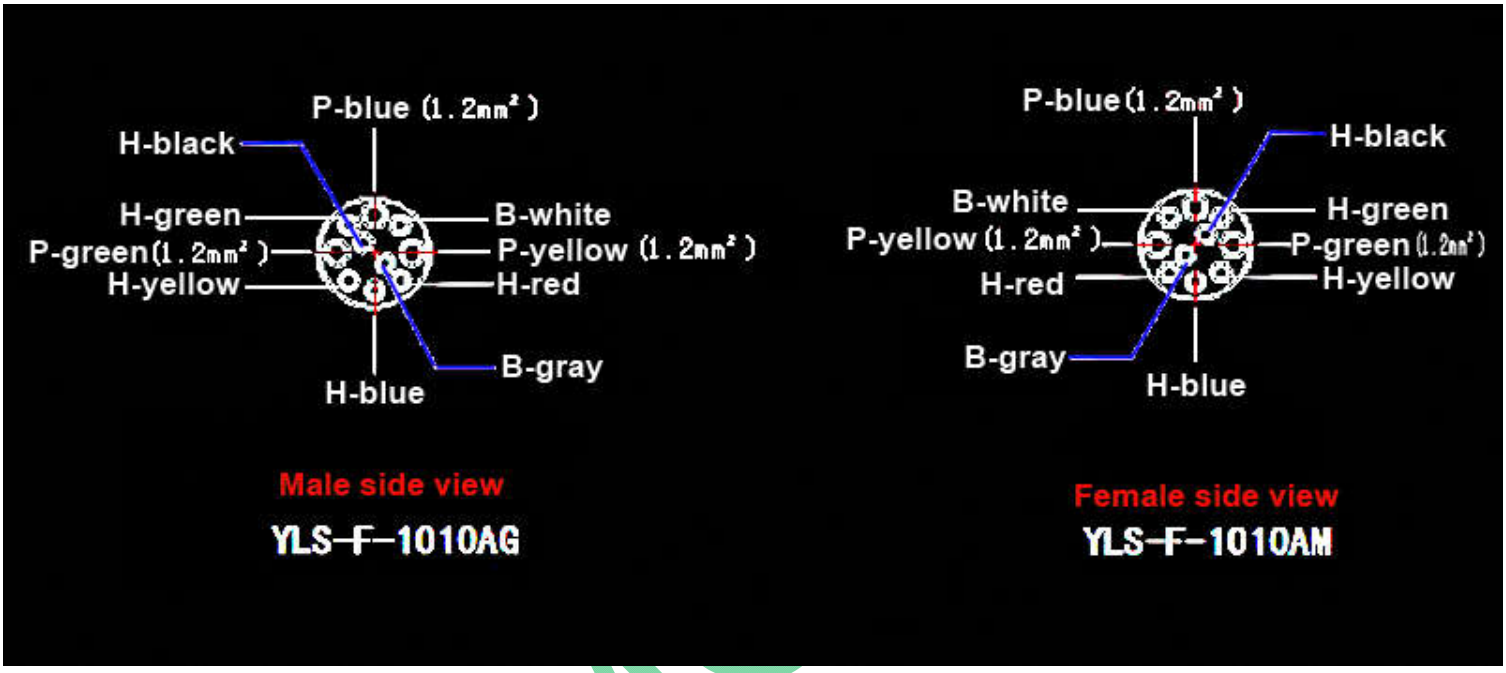
Controller			MX ES WCDCSPV2.2
RATED	Max continuous（A）(for each motor)		20A
	primary circuit	Working voltage（V）	18-60V
		Max phase current（A）	40A(each motor)
SPEC	Drive method		SVPWM: sine wave
	Signal Feedback		Hall sensors/without hall sensors
	Operation Condition	temperature	0～+50℃ / -25～+55℃
		humidity	<90%RH）
		vibration/lash resistance	4.9m/s² / 19.6m/s²
		IP Code	IP67
	Protection		Over current,over load, under-voltage

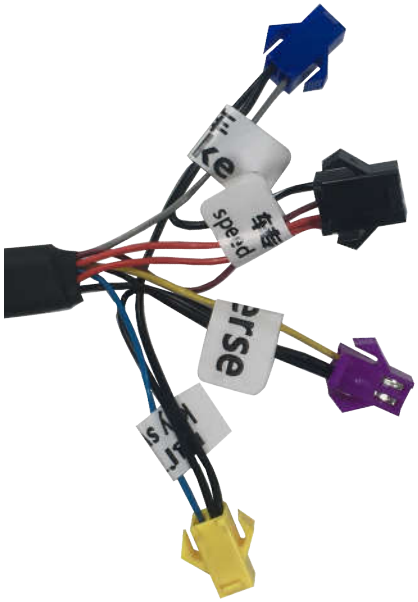




A: Right side motor cable (right hand side when sitting in the wheelchair)
B: communication cable
C: Battery power cable
D: Left side motor cable (left hand side when sitting in the wheelchair)

The motor cable wires diagram



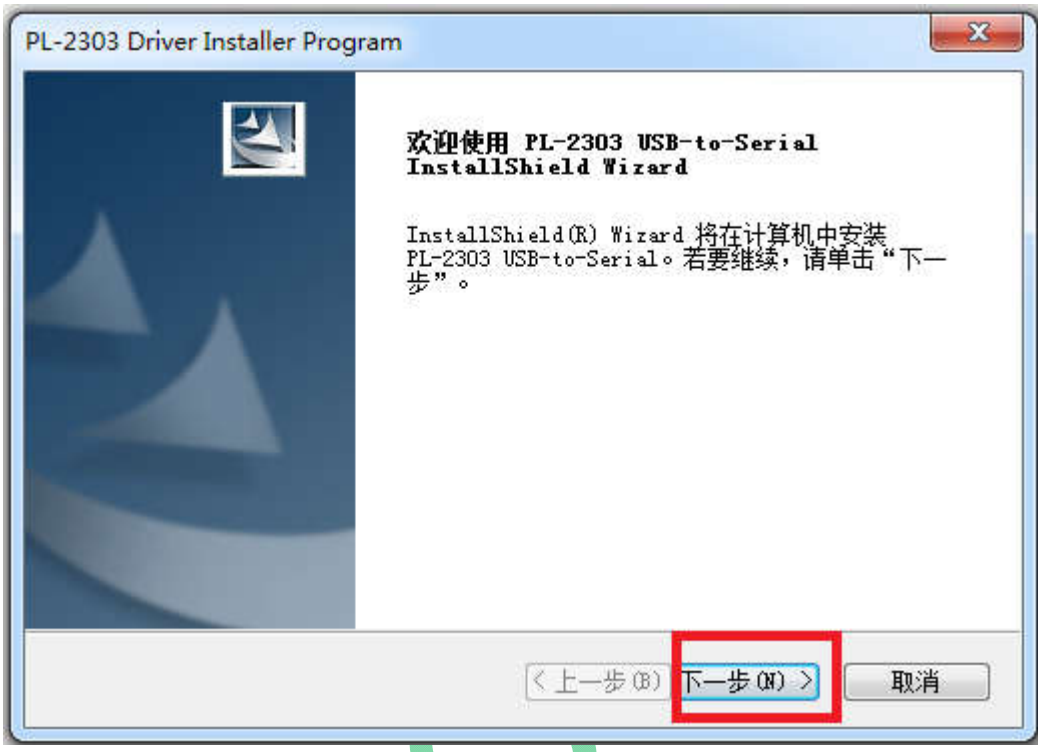


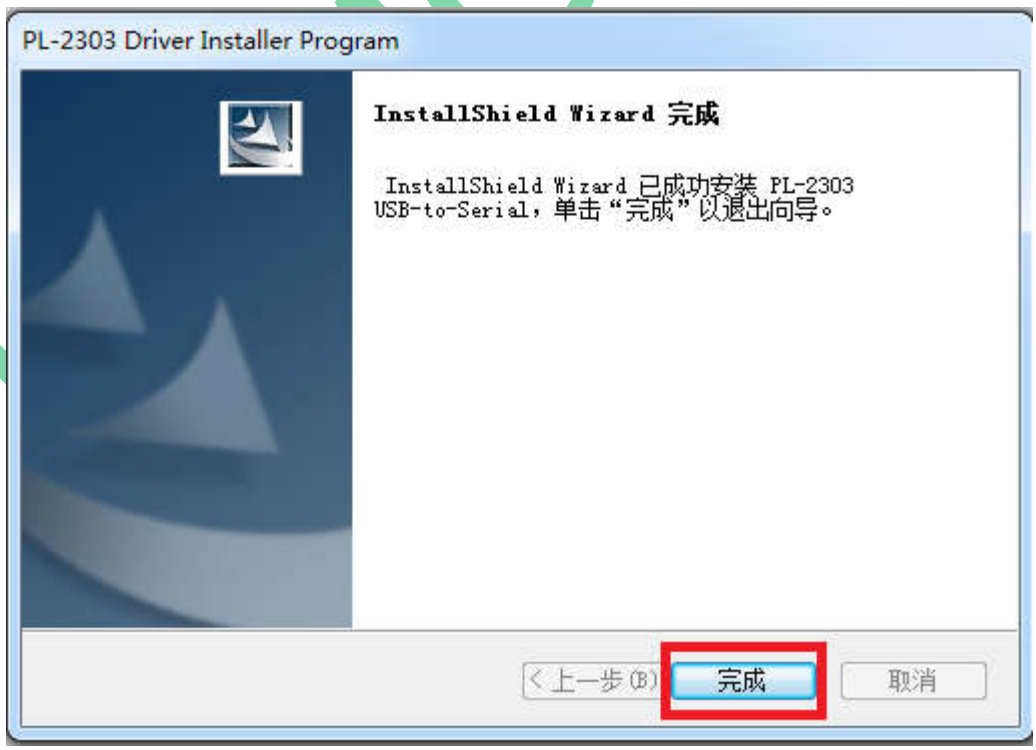
1. brake { gray / black
2. throttle { red:+5V / brown:speed signal / black
3. power switch { blue / black
4. reverse { yellow / black

Software and USB driver

3.1 install programming software driver

3.1.1 Double click MX ES DriverInstaller.exe

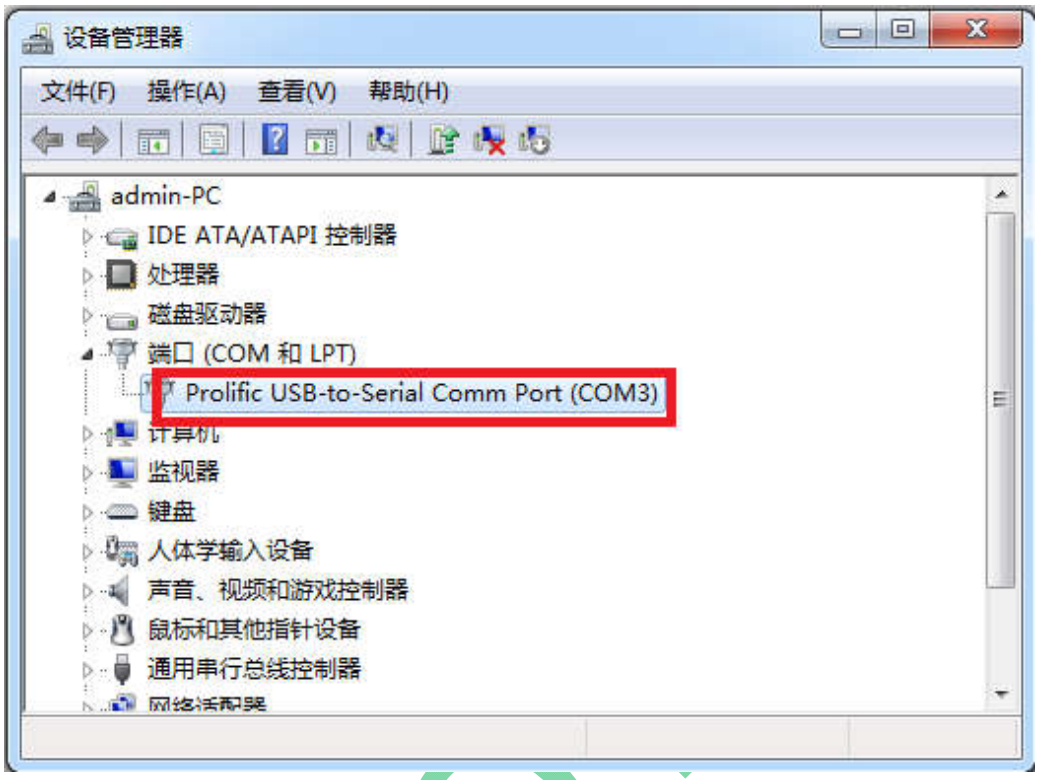




3.1.2 Connect programming USB to computer

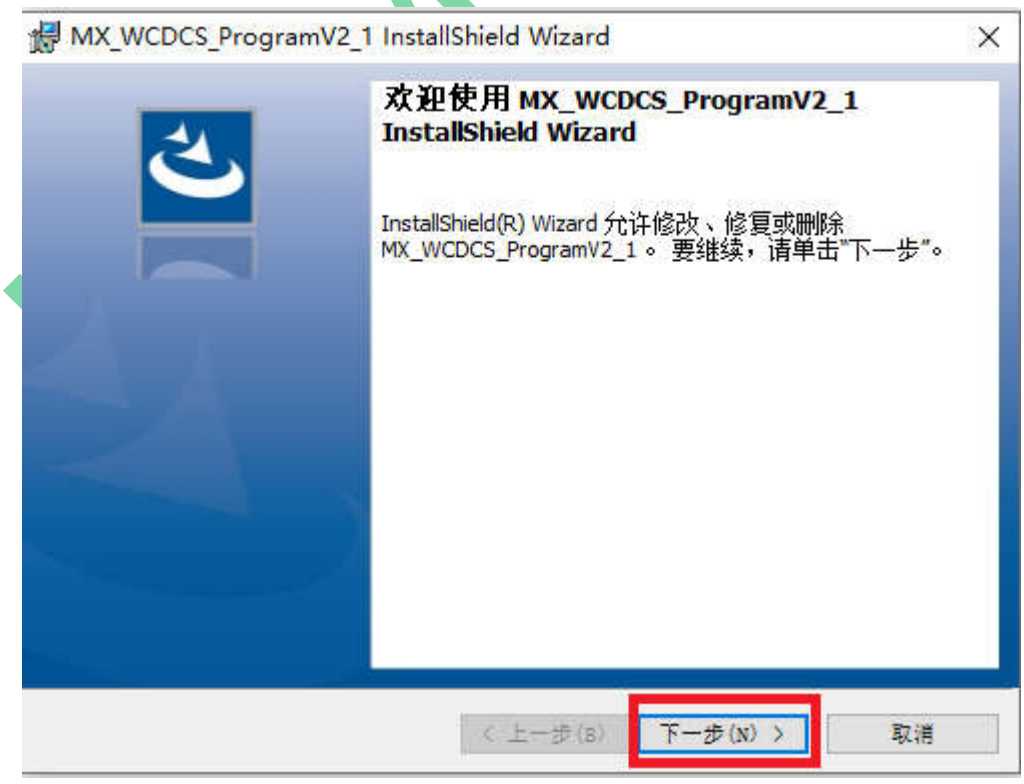
3.1.3 Check whether driver is installed

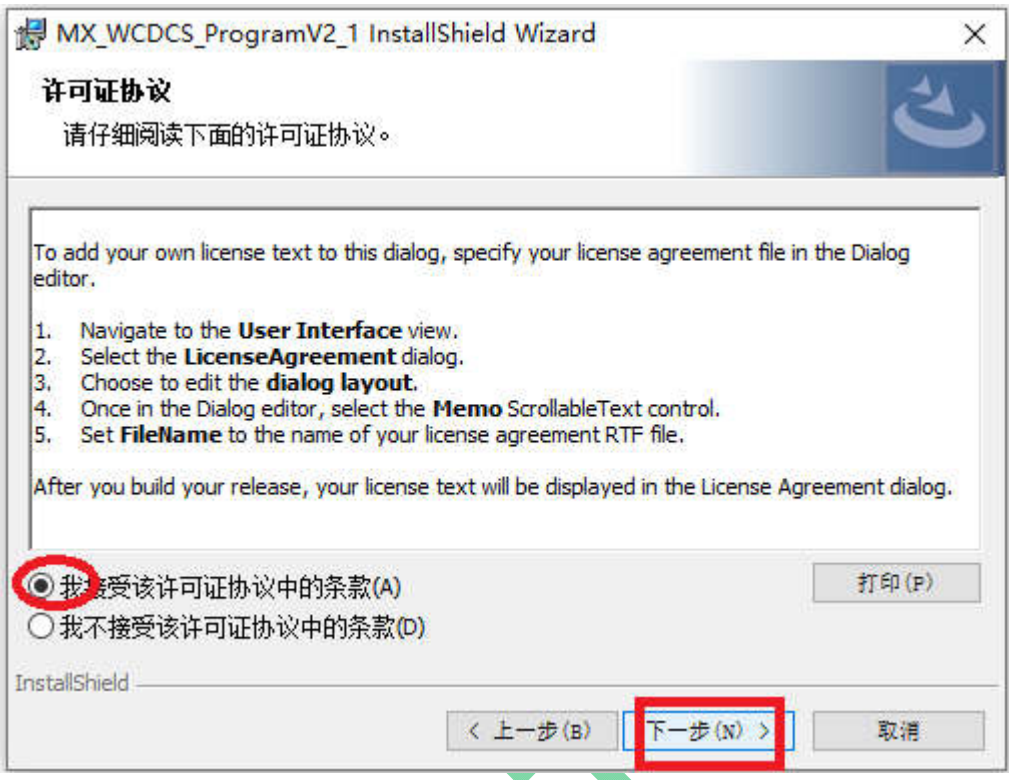
Open “computer” ,“Device Manager”，check the port number and it is successful,this demo installation driver power is **COM3**



3.2 install programming software

Double click **setup.exe**





MX_WCDCS_ProgramV2_1 InstallShield Wizard
许可证协议
请仔细阅读下面的许可证协议。
To add your own license text to this dialog, specify your license agreement file in the Dialog editor.
1. Navigate to the User Interface view.
2. Select the LicenseAgreement dialog.
3. Choose to edit the dialog layout.
4. Once in the Dialog editor, select the Memo ScrollableText control.
5. Set FileName to the name of your license agreement RTF file.
After you build your release, your license text will be displayed in the License Agreement dialog.

取消

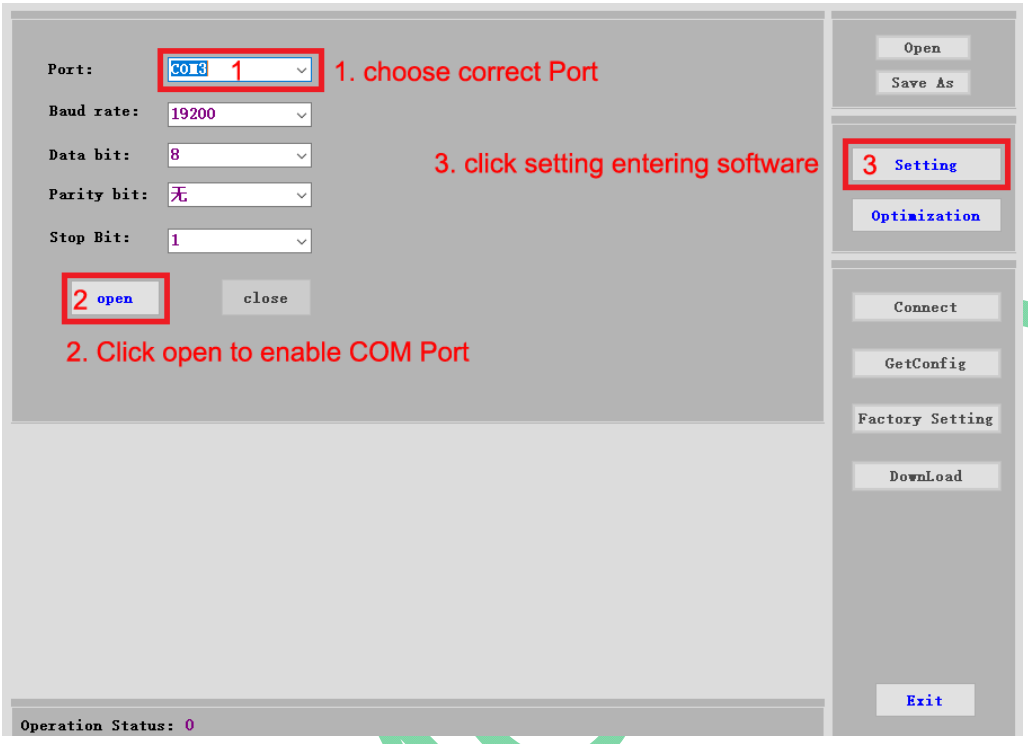
When finished, there will be an icon 

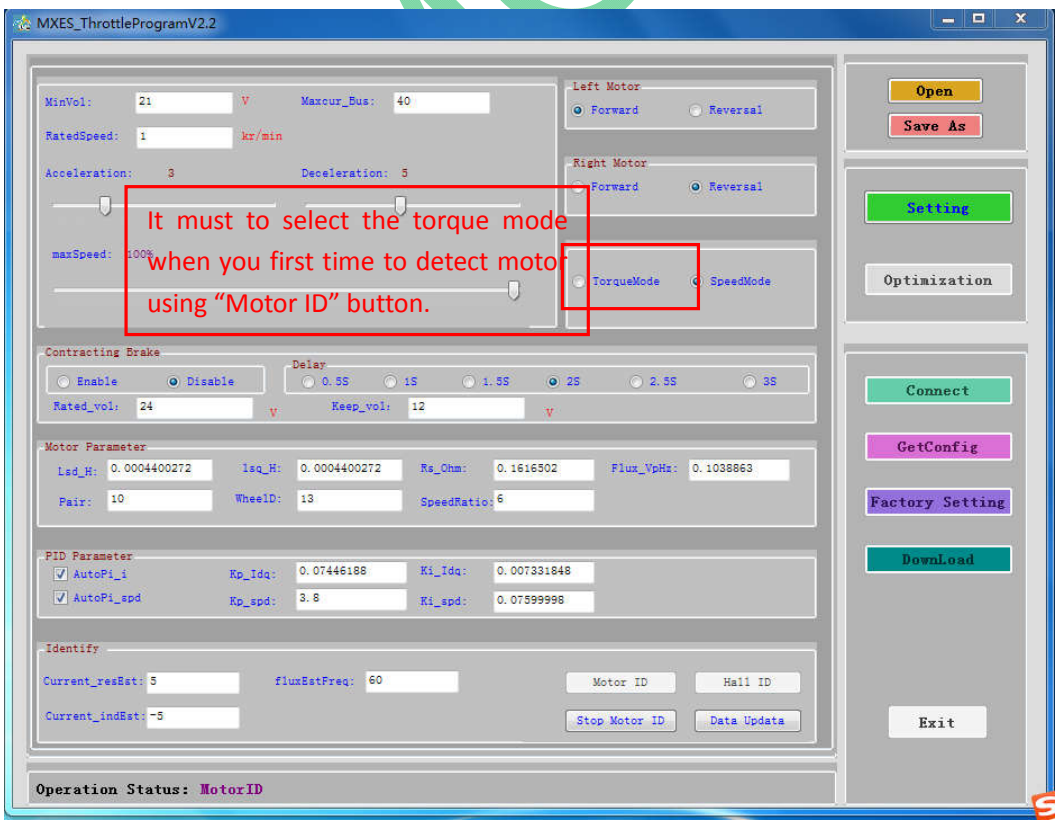
Close all your antivirus and safetyguard software before you download and install software and driver

3.3 software introduction

Open the software icon, you will see the following window

Note：this（COM3）is demo installation port should be the same as MXES driver portnumber. Different computer, this port number may be different, you need to choose the correct port number for software.

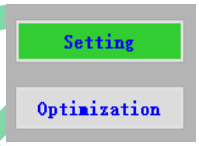




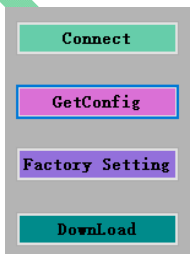
Choose the right COM port and click the “**open**” button and then the “**setting**” button, then you will see the programming window as follows:

1. Command buttons

Open: import parameter data files to controller.
Save As: export controller current data to be a file.



Setting: set parameters
Optimization: not avaiable now.

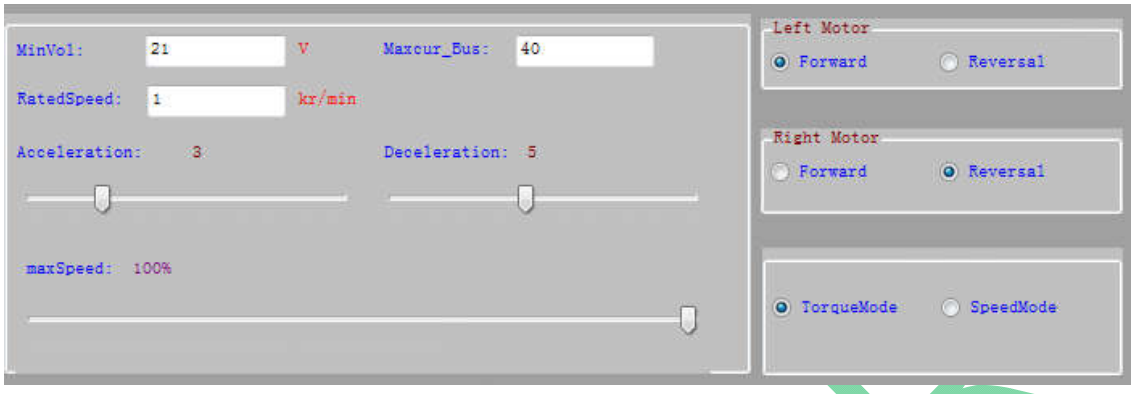


Connect: connect software and controller.
GetConfig: get controller configuration.
Factory: Recover factory default setting.
DownLoad: Save parameter to controller.

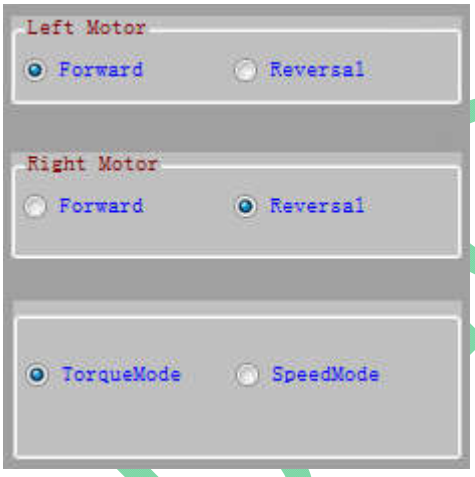
Exit: Exit the programming software

The data transmission sometimes is slowly, please pay attention to the button of the “operation status”.

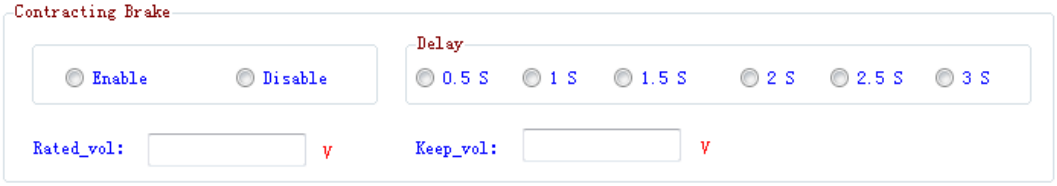
2. Parameter settings



Minvol: bottom voltage	**RatedSpeed**： Kr/min
Maxcur_Bus: max Bus current	
Acceleration: max speed accelerate set	**Deceleration**: motor brake time
MAXspeed: speed limit function	

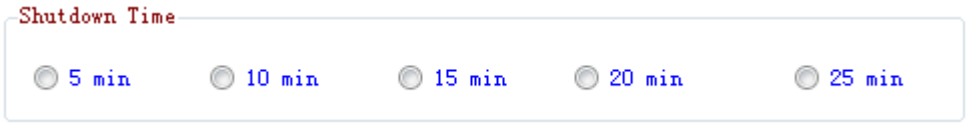


Forward: Adjust motor's rotation to forward
Reversal: Adjust motor's rotation to reverse
TorqueMode : set the motor run in torque mode. Throttle adjust the torque
SpeedMode: e braking, throttle only adjust speed, torque can be always big

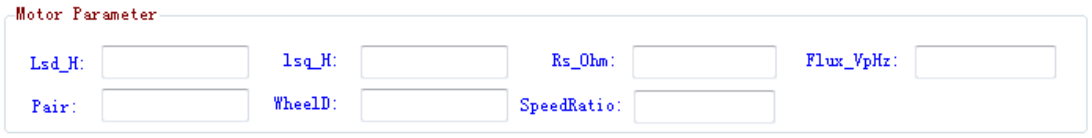


Enable: Enable EMB braking function	**Disable**: Disable EMB braking function
Dealy: Braking delay. The time for E,B braking close/brake after the joystick back to zero position.	
Rated_vol: EMB braking rated voltage, the EMB braking working rated voltage	
Keep_vol: EMB braking voltage open/release when the motor is running	

Enable: enable reversing alarm sound	**Disable**: To disable reversing alarm sound

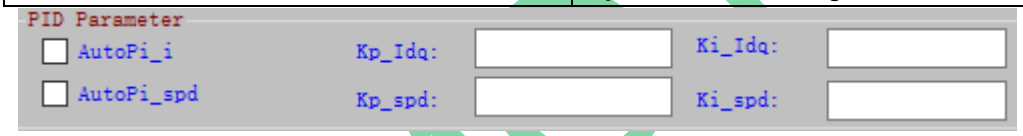


Shutdown Time: to set auto cut off power time when the wheelchair is not operated.



Motor Parameter:

Lsd_H: motor inductance value（the value of Lsq_H and Lsd_H must be the same）	
Lsq_H: motor inductance value（the value of Lsq_H and Lsd_H must be the same）	
Rs_Ohm: motor resistance	
Flux_VpHz: motor EMF	**Pair**: motor pairs
WheelD: motor wheel size（inch）	**SpeedRatio**:motor gear ratio



When using “MotorID”, AutoPi_i, Kp_Idq and Ki_Idq will be auto filled by controller.
When do not use “MotorID”, AutoPi_i, Kp_Idq and Ki_Idq can be input manually.
When using “MotorID”, AutoPi_spd, Kp_spd and Ki_spd will be auto filled by controller
When do not use “MotorID”,AutoPi_spd, Kp_spd and Ki_spd can be input manually.

Current_resEst: the resistance current for reading motor data
Current_indEST: the inductive current for reading motor data
fluxEstFreq: the frequency for reading motor data
Current_resEst, **Current_indEST** and **fluxEstFreqa:** the default value does not need to change for most motors

Status at the bottom of the software window

Charpter four: simple guide for programming

4.1 Brief

When new motors connected to our joystick controller, the controller may not work with the motors due to the phase angle and hall sensors issues. So we need to use the program software to read the motor data and can make controller work with motors.

4.2 To set controller with motor

1.Connect the joystick, controller,motor and battery together. Press the joystick power  on/off button to turn on the system.

2. connect the programming USB cable to computer and joystick.

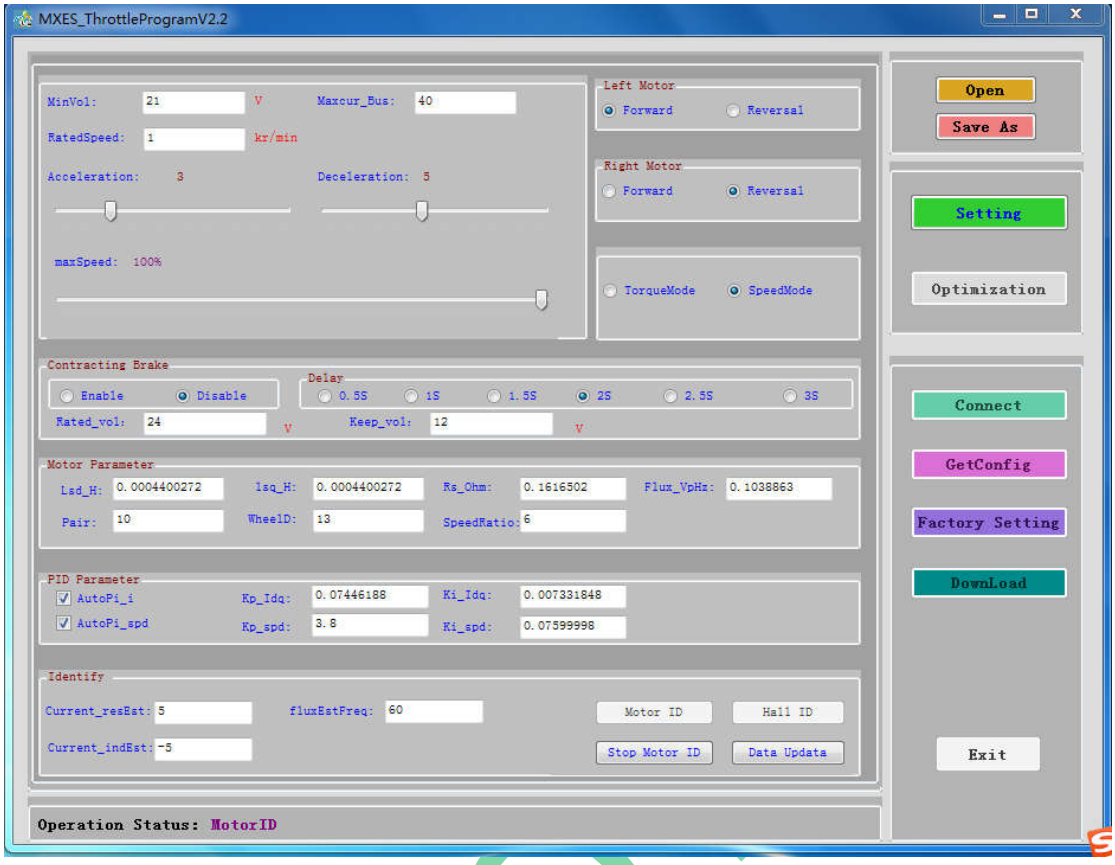
3. Open the software from the ico 

and choose the correct COM port 

4. click the “**open**” button 

5. click the “**Setting**” button 

, then programming software window as follows:



6. Click the "**connect**" button  , connecting the software and controller.(each time re-boot the controller(power on/off), you need to re-click the "**connect**" button)

7. Click the "GetConfig" button  , to get the controller data.

8. Modify the data as you like and then click the "download" button  , to save the data to controllers.

9. If you need to recover the controller default data, please click the "Factory Setting" button  .

4.3 to make motors and controllers working together

Repeat the "**4.2 set controller with motor ” step 1 to step 5.**

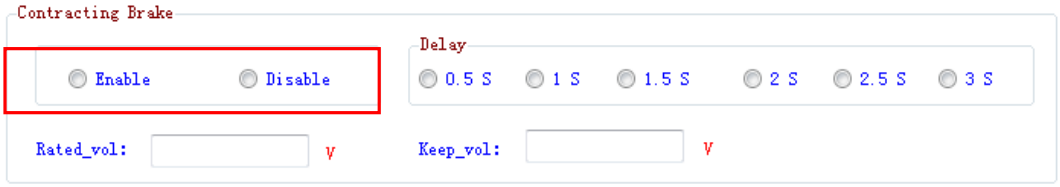
6. click the "Connect" button  , connecting the software and controller.

7. Click the "GetConfig" button  , get the controller data.

8. Click the "Motor ID" button  , controller starts to read motor data, at current time, **one of the motors will make small noise first, and then for a while , the**

motor will auto running. If the motor shaking and big noise, please click the “Stop Motor ID” button 
to stop the motor data reading. Check the all the wires connections and power supply, and then re-start the “Motor ID”

(Do make sure the motor’s EMB is on or released, or you cannot get the motor run. You need to switch the EMB on motor according to the software setting, Disable or Disable.)



9. After the motor data is read, the motor will auto stopped, at current time, to click the “Data Updata” button 
to save the motor data to the controller.

10. To read hall sensors data. Click the “Hall ID” button 
, When the bottom “Operation Status” appears **HALL ID**, **press the throttle,** the motor will run and stop in a very short period. At this moment, the motor hall sensors data is stored. The controller will be ok to drive motors after all these set.

11. If the motors running direction are not correct, for example one is forward and one is backward, or both backward. It needs to re-click the “Connect” button 

to communicate with controller again. Click the “GetConfig” button 

to get controller saved date and then adjust the motor running direction from ”Forward” and “Reversal” button 

, then Click “DownLoad” button 

to save the changed parameter.

Note:

1. Each time click the control button on the software , the bottom will shows the status.
2. To operate the software, you need to Click the “Connect” button each time after you used joystick when setting data. Because when you push joystick, the USB cable communication will be closed. That is why you need to re-click the “Connection” button re-communicate the software with controller.
